EN\_PWR – supply external voltage (3.3V) that can be jumpered to EN pins.

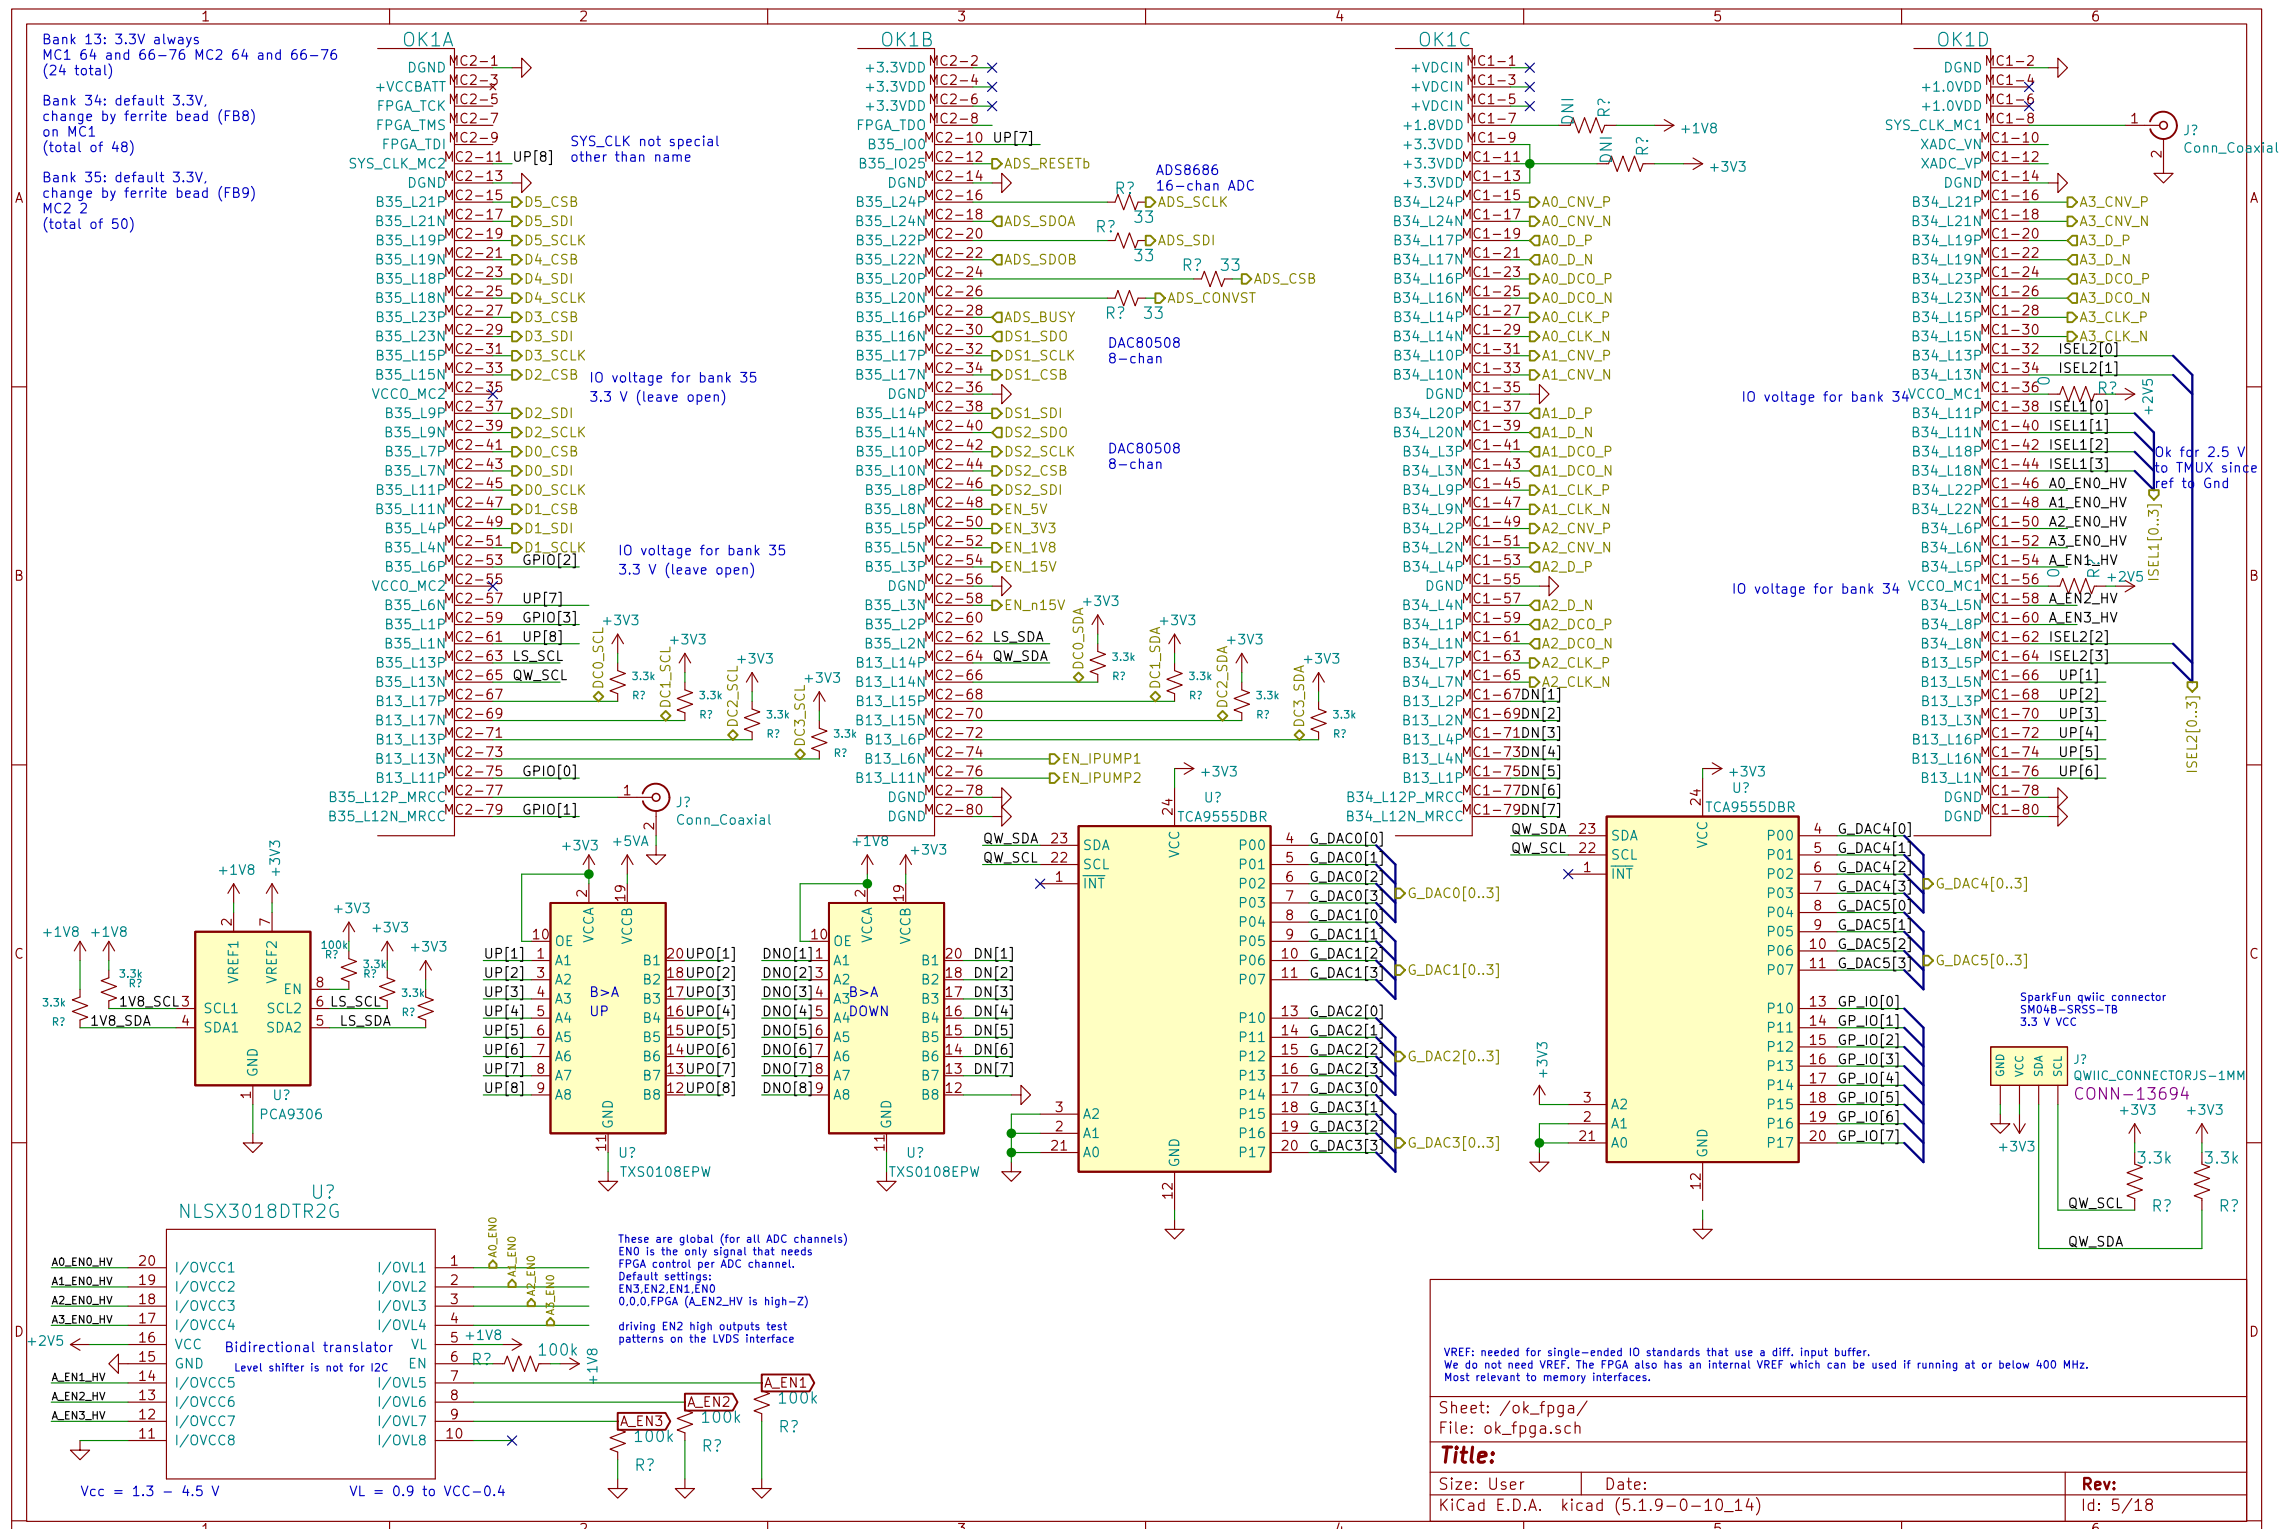

Default is to control by FPGA, have 0 Ohm Rs installed, and no jumpers on the header.

Alternative option is to add jumpers (and if EN\_PWR is > 3.3 V) remove 0 Ohm.

## What is VCCBATT?

Do a check of skew matching between DCO and D for high-speed ADC

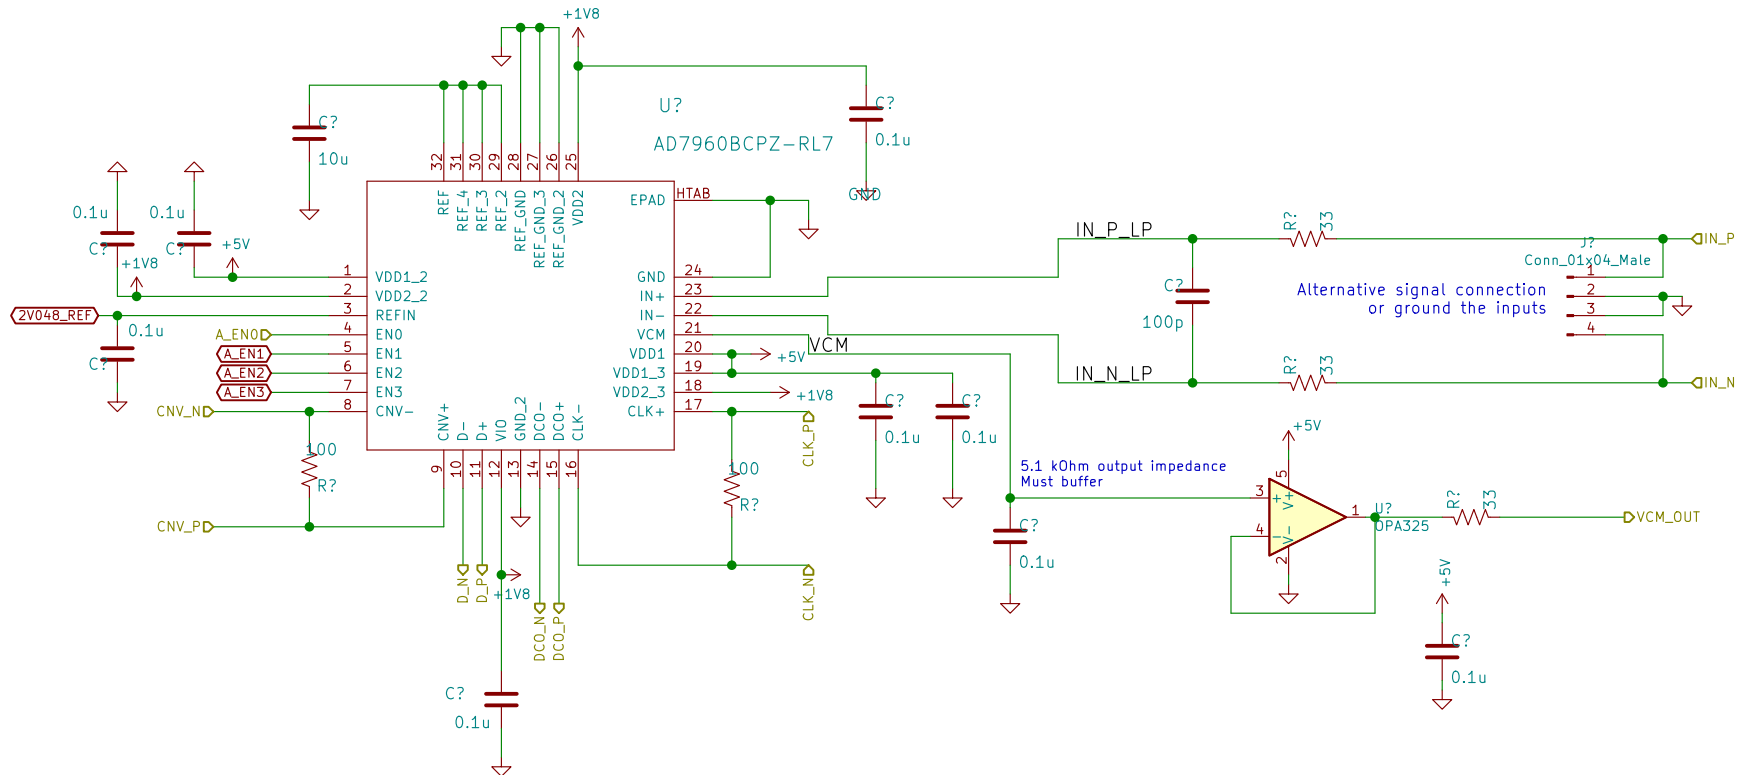

The dual SPI interface has sufficient BW to clock the data out at the 1 MSPS (just need 16 MHz clock rate)

Use internal buffer (x2) with 2.048V ref.  
 "External reference of 2.048 V applied to the REFIN pin  
 (high impedance input). The on-chip buffer gains this by 2  
 and drives the REF pin with 4.096 V"  
 EN3=X, EN2=0, EN1=0, EN0=1 (28 MHz BW)  
 EN3=X, EN2=1, EN1=0, EN0=1 (9 MHz BW, use this BW only when the throughput is 2 MSPS or lower)  
 VDD2 and VIO can come from the same supply.  
 But route and decouple separately.

VREF buffer  
9 kOhm VREF input resistance  
Gain to 10 V (AD5453 max is 12 V)  
22 MHz gain-bandwidth

10 V ref -> x4.88, +/-15 V  
3.33 V ref -> x1.628, +/-5 V  
1.333 V ref -> x0.649, +/-2 V  
0.333 V ref -> x0.161, +/-500 mV

inverting so gain can be less than 1
